

Arrange Networks and Trees

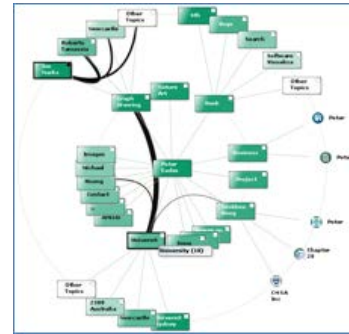

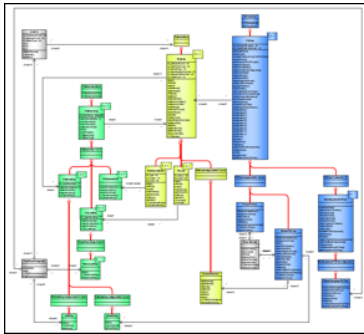

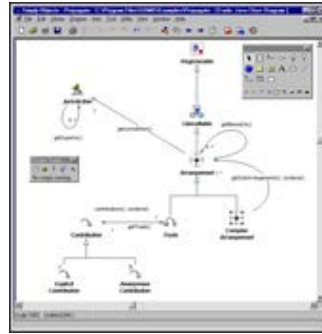

Cmpt 767 - Visualization

Steven Bergner

sbergner@sfu.ca

[incl. sides from Moeller/Munzner/Eades/Sedlmair]

Networks & Graphs

etc.

Overview

- Connection and Containment Channels

Arrange Networks and Trees

➔ Node-Link Diagrams Connection Marks

NETWORKS TREES

➔ Adjacency Matrix Derived Table

NETWORKS TREES

➔ Enclosure Containment Marks

NETWORKS TREES

Readings

- Munzner, “Visualization Analysis and Design”:
 - Chapter 9 (Arrange Networks and Trees)
- Heer 2018, CSE512 - *Data Visualization*

Applications

- Tournaments
- Organization
- Charts
- Genealogy
- Diagramming (e.g., Visio)
- Biological Interactions (Genes, Proteins)
- Computer Networks
- Social Networks
- Simulation and Modeling
- Integrated Circuit Design

Goal of Spatial Layout

Place nodes and edges to optimize

- Connectivity
- Path-following
- Topological distance
- Clustering/grouping
- Ordering (i.e. hierarchy level)

Connection vs. Containment

- relevant for drawing graphs + trees
- containment -- essentially treemaps
- connection -- traditional view of graphs
- Different information - equal vs hierarchical

Tree-map

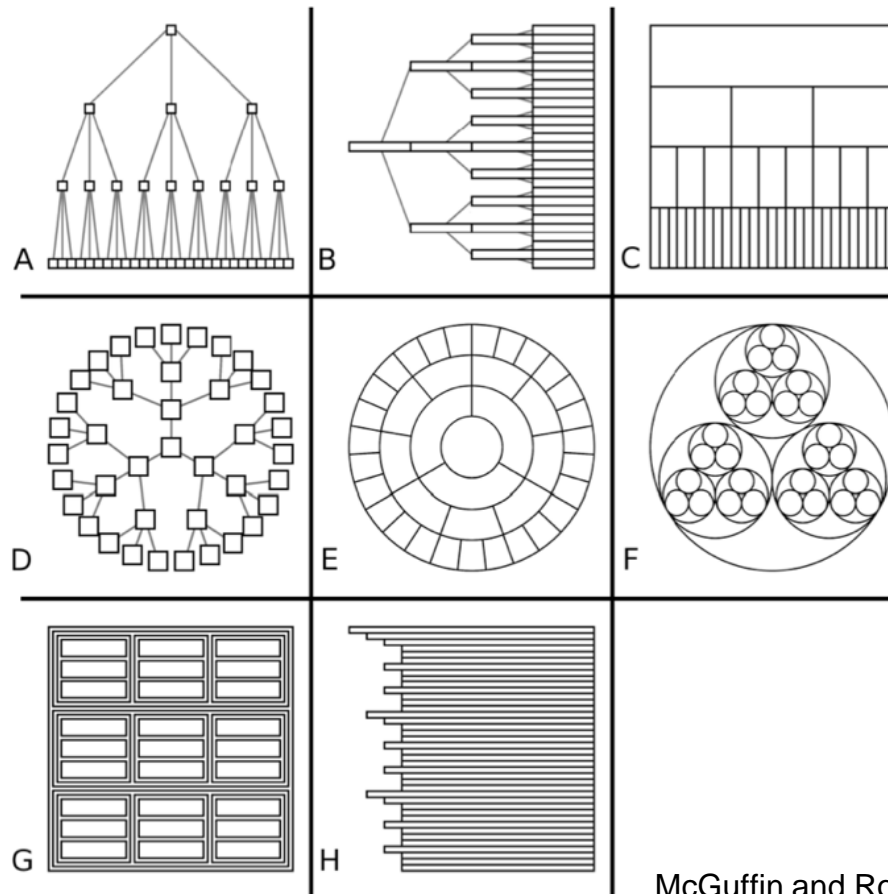

Node and link diagram

Treemap

Connection vs. Containment

- Eight visual encodings of the same tree dataset

Tree layouts

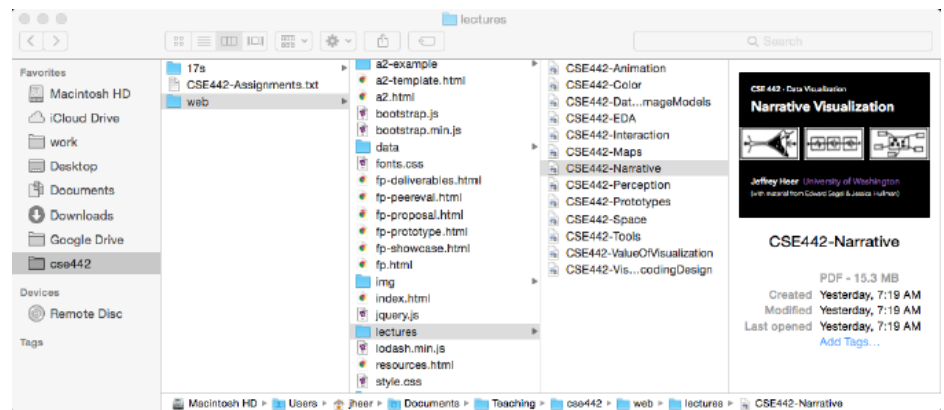

- Indentation: File directory style

Folder
Subfolder
File1
File2

- Single focus: accordion style

– Separate breadth and depth along 2D and focus on a single path at a time

– Example:
Mac File Explorer

Enclosure Diagrams

Set theory style

- Pros
 - Provides single view of an entire tree
 - Easier to spot large/small nodes
- Cons
 - Difficult to accurately read structure/depth
- Examples
 - Circle Packing Layout
 - Tree Maps

Node-Link Diagrams

Traditional data structure style

- Naive Recursive Layout Algorithm
- Reingold and Tilford's "Tidy" Layout Algorithm (linear time algo)
- Cluster Dendograms
- Radial Tree Layout
- Hyperbolic Layout
- Sugiyama-Style Layout
- Force-Directed Layout: Uses Barnes-Hut algorithm
- Degree-of-Interest Trees (expansion-by-interest)

Treemaps

- Squarified Treemaps
 - Greedy optimization for objective of square rectangles
- Cushion Treemaps
 - Shading to emphasize hierarchical structure
- Cascaded Treemaps
- Voronoi Treemaps
 - Iterative, weighted Voronoi tessellations to achieve cells with value-proportional areas

More Tree Vis Methods

- Layering
 - Sunburst Trees: Use polar partition
- Matrix Diagrams
- Use Attributes to drive layouts
- Pivot Graph
 - Roll-Up and Selection Operators
- Hive Plots

Graph Drawing

- The classical graph drawing problem is to develop **algorithms to draw graphs nicely**.

graph

A - B, C, D
B - A, C, D
C - A, B, D, E
D - A, B, C, E
E - C, D

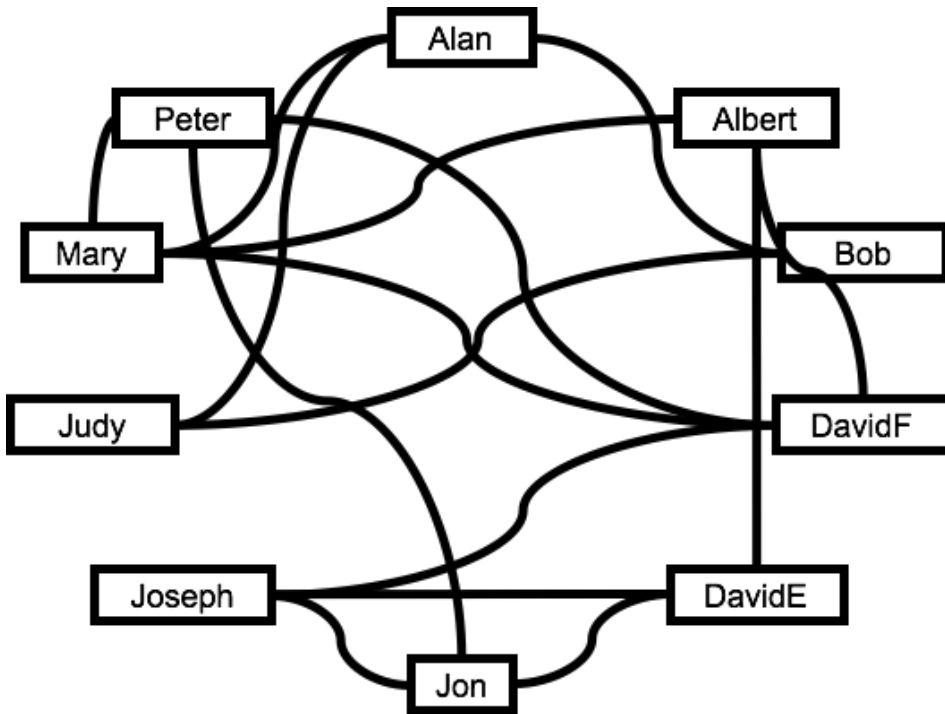

nice graph drawing

Example

<i>x</i>	<i>Adjacent to X</i>
Mary	Peter, Albert, DavidF, Peter
Judy	Bob, Alan
Peter	Mary, DavidF, Jon
DavidF	Albert, Joseph, Peter, Mary
Jon	Peter, Joseph, DavidE
DavidE	Jon, Joseph, Albert
Joseph	DavidE, Jon, DavidF
Bob	Judy, Alan
Alan	Bob, Mary, Judy
Albert	DavidF, Mary, DavidE

Example

Example

Example

- Terrorist network

Example

- Mobile phone network:
 - nodes: people
 - edges: phone calls

Good deal \$\$\$\$

Example

- Transport network:
 - nodes: places
 - edges: train lines

Example

- Transport network:
 - nodes: places
 - edges: train lines

Shortest path?

What algorithm gives good drawings of graphs?

Bad

Good

Quality measures for networks

- Classical quality measures
 - minimize edge crossings
 - minimize bends
 - ...
- Human subject experiments found crossings & bends to be most important *wrt* readability
 - Purchase et al., 1997
 - Ware et al 2002
 - Huang et al 2004

Different kinds of layouts

grid-based

orthogonal

straight-line

Force-directed layouts

© Sander

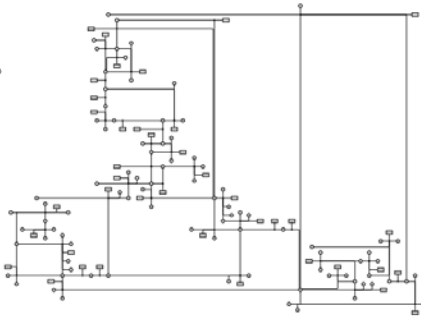

<https://bl.ocks.org/mbostock/4062045>

Human-centered layout

- User study
- Develop algorithm
- Evaluate algo-created layouts against human-created layouts

Human

algo-yFiles

algo-HOLA
(new)

Kiefer et al. (InfoVis 2015).
HOLA: Human-like Orthogonal Network Layout

Scalability

Too many
nodes and/or edges

More Nodes, More Problems

- Tree breadth often grows exponentially
 - Quickly runs out of space, even with tidy layout
- Possible solutions
 - Filtering
 - Focus + Context
 - Scrolling/Panning
 - Zooming
 - Aggregation

Showing all the data?

<https://twitter.com/axelmaireder/media>

Hairball

Measures: Faithfulness VS. Readability

Faithfulness measures how well the diagram represents the data.

(a mathematical concept)

Readability measures how well the human understands the diagram.

(a psychological concept)

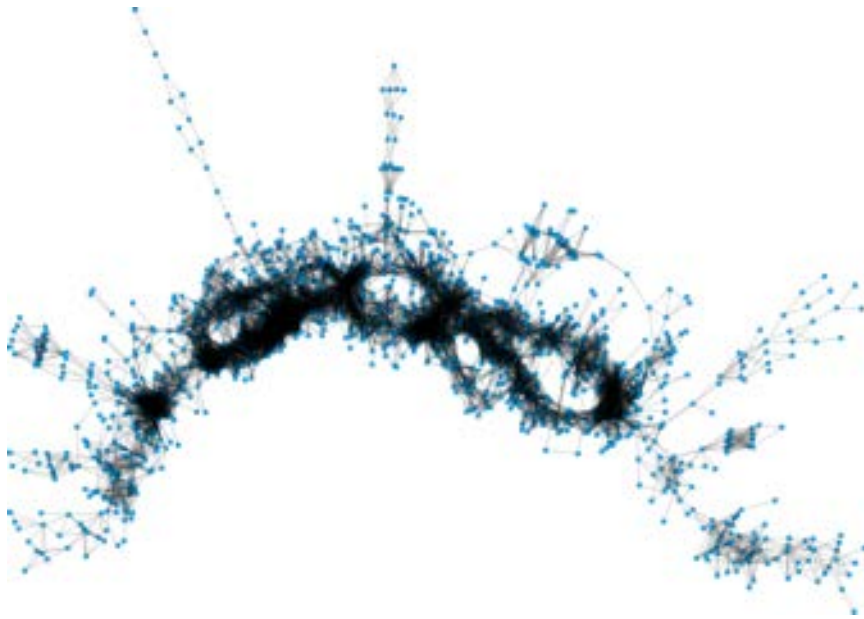

*Quan Nguyen et al.
(PacificVis 2013).
On the faithfulness
of graph visualizations*

In small graphs: faithfulness usually given

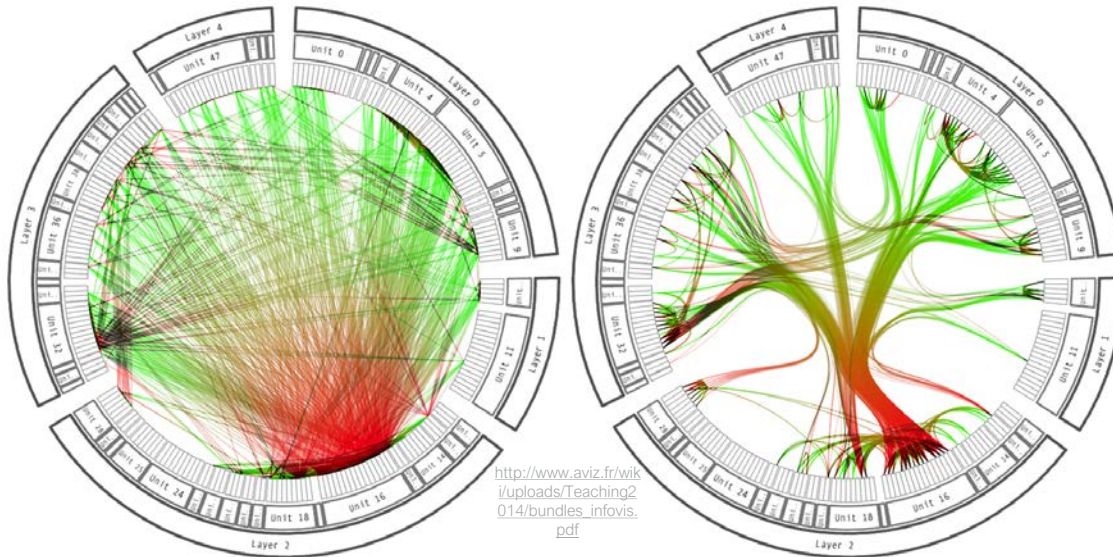

—> optimize readability

In large graphs: faithfulness usually not given

—> tradeoff between faithfulness & readability

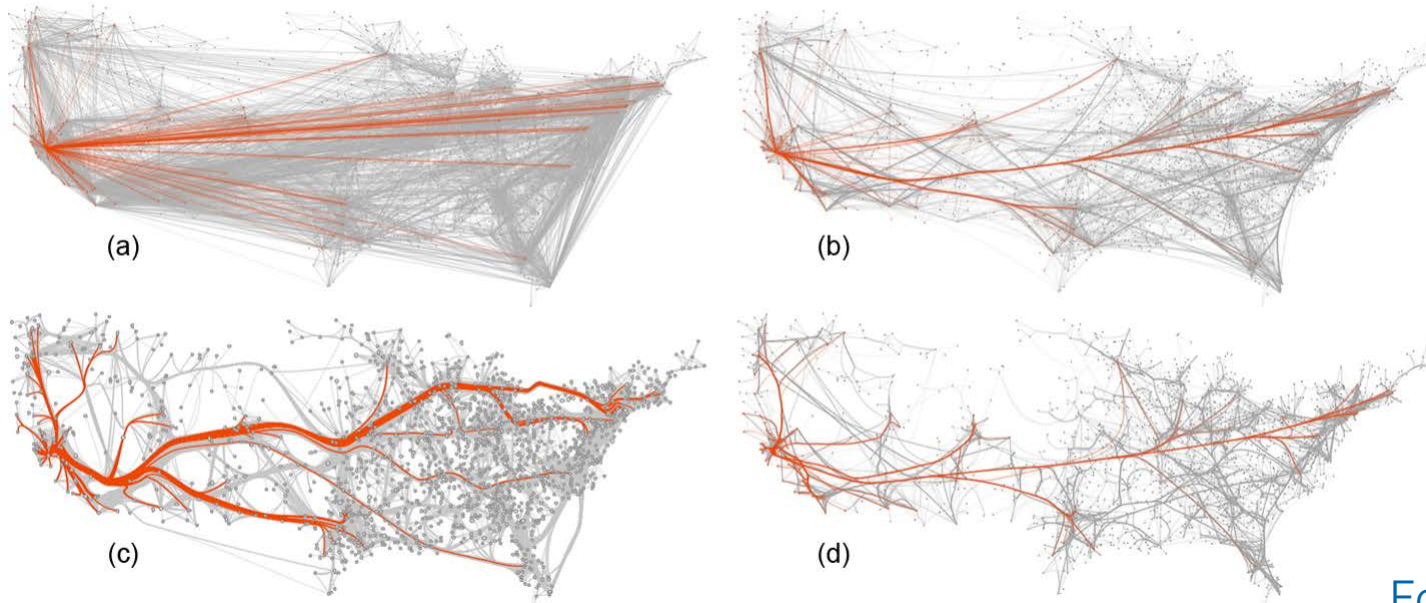

Edge bundling

Sacrifice
faithfulness,
gain readability

Holten (InfoVis 2006).
Hierarchical Edge Bundles:
Visualization of Adjacency Relations in Hierarchical Data

Edge bundling

US migration graph

*Holten & van Wijk
(EuroVis 2009).
Force-Directed Edge
Bundling for Graph
Visualization.*

What about edge crossing?

- Some quality measures that work well for small graphs (such as edge crossing) seem to lose their importance the larger a graph gets

<http://eppsnet.com/images/facebook-hairball.png>

How many edge crossing do you see?

Instead: “Show me the structure”

A

B

“Diagram A is better than diagram B because diagram A shows the structure of the graph, and diagram B does not show the structure.”

Shape

draw

shape

Adjacency Matrix (physical)

Jacques Bertin, 1968

<http://www.aviz.fr/wiki/uploads/Bertifier/bertifier-authorversion.pdf>

Matrix or Node-link?

- Study
 - 36 users
 - 9 networks
 - 7 tasks → measure time & errors
- Results
 - **Node-link** only for:
 - small graphs (~20 nodes)
 - path finding tasks
 - Else **Matrix**
- Limitations

*Ghoniem et al. (InfoVis 2004).
A Comparison of the Readability of
Graphs Using Node-Link and
Matrix-Based Representations.*

Patterns in different views

- Node-link views and Matrix views
- Both can show cliques and clusters

[McGuffin 12, Figure 6]

Additional encodings

Color and width

Additional encodings

- Nodes, e.g. through color
- Edges, e.g. stroke-width

Size

<http://mbostock.github.io/d3/talk/20111116/force-collapsible.html>

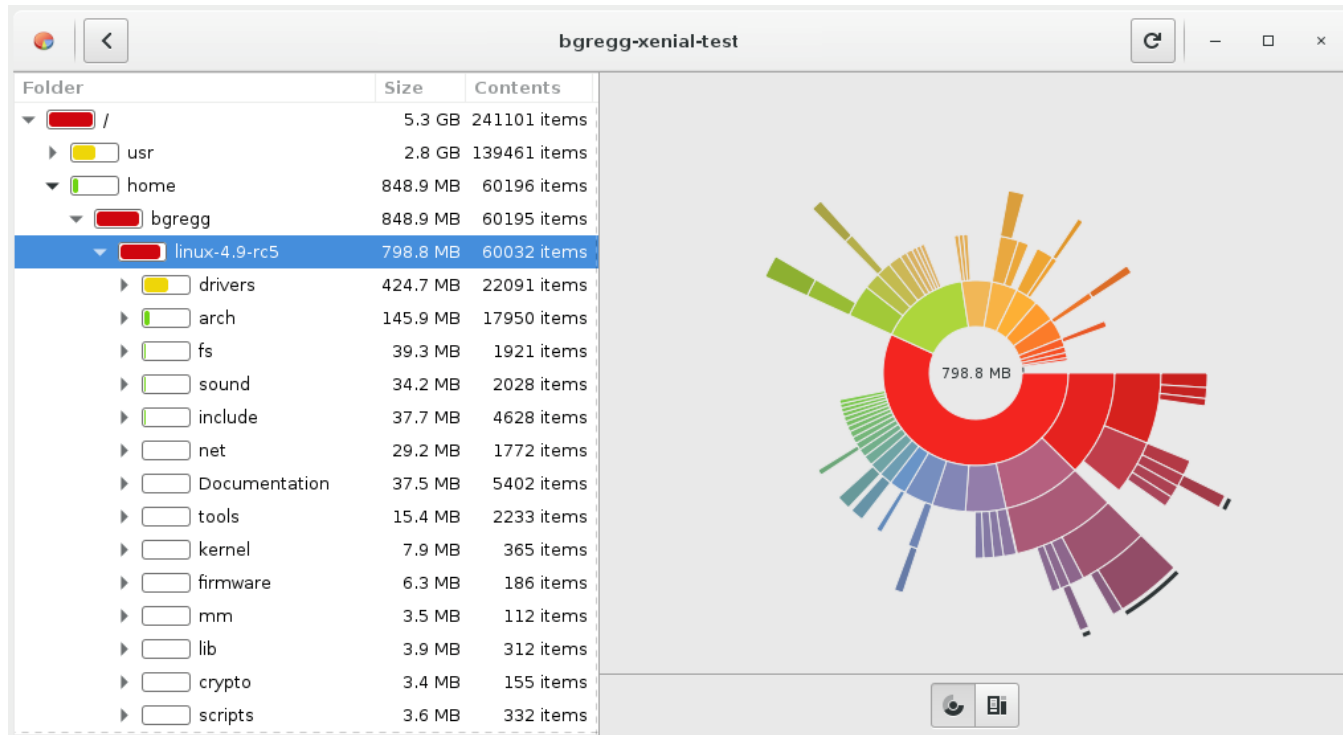

More complex data

Stef van den Elzen and Jarke J. van Wijk (InfoVis 2014)
Multivariate Network Exploration and Presentation:
From Detail to Overview via Selections and Aggregations

Combined methods

- Overcome limitations of individual method
- Example: Baobab disk space analyzer

Indented tree view

Sunburst view

Misc concerns

Animated Graphs

- static radial layouts: known algorithm
- dynamic: little previous work
 - DynaDAG [North, Graph Drawing 95]
 - DA-TU [Huang, Graph Drawing 98]
- minimize visual changes
- stay true to current dataset structure
- video

Animated Graphs

- polar interpolation

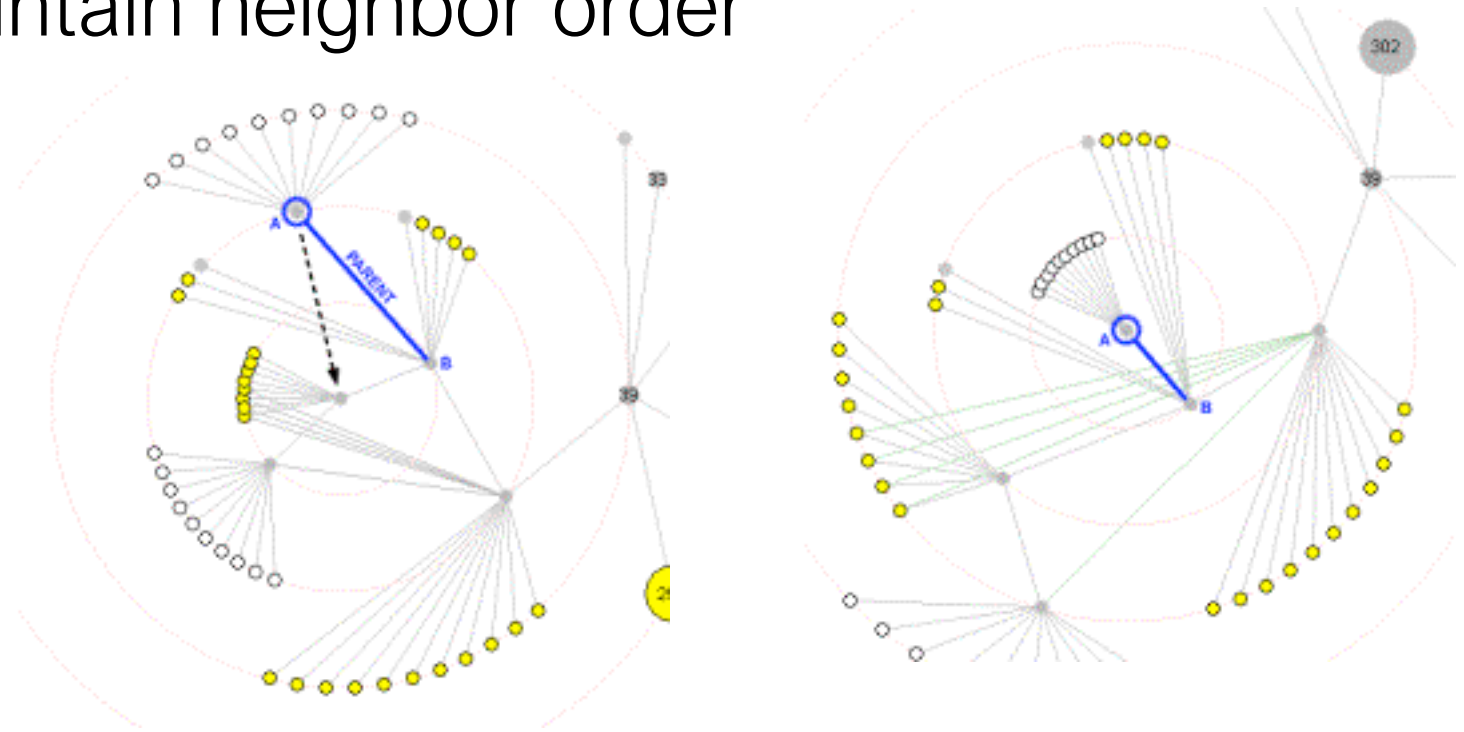

Figure 3. Interpolation in rectangular coordinates (left) can yield a confusing animation. Interpolation in polar coordinates (right) works better for radial layouts.

Animated Graphs

- maintain neighbor order

Yee et al. Animated Exploration of Graphs with Radial Layout

Small-World Networks

- high clustering, small path length
 - vs. random uniform distribution
- examples
 - social networks
 - movie actors
 - Web
 - software reverse engineering
- multiscale small-world networks
 - exploit these proper ties for better layout

On-line graph drawing

- required by ‘streaming data’
 - e.g. update graph with new/disappearing nodes and edges
- graph layout without knowing the final graph
- updates should be
 - visually easy to follow (minimal)
 - in real-time

Overview

- Spatial channel
 - Spatial attributes / keys
 - quantitative vs. categorical attributes
 - Keys: the importance of ordering
 - list (1D) vs. matrix (2D) vs. partition / subdivide (multiple D)
 - Spatial layout
 - rectilinear
 - parallel
 - radial
 - Spacefilling
 - Dense
- Linemarks
 - Connection
 - Containment
- Using color
